DETAILED ACTION

Double Patenting

1. Claims 1-30 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claim 44 of U.S. Patent No. 6,650,652. Although the conflicting claims are not identical, they are not patentably distinct from each other because the patented claims state a system for transmitting a flow of data over a network, comprising: means for receiving a plurality of flows of packets from a plurality of sources (a receiver operable to receive a packet flow). And means for detecting a pause in a selected one of the flows of data (a detector operable to determine if the packet flow includes a pause). The patented claims also teach a means for modifying the manner in which packets are transmitted upon detection of the pause in the selected flow. This limitation indicates that the previously recited limitations may be modified in the event a pause is detected. The previous limitations include a means for fragmenting packets within one or more of the plurality of flows exceeding a maximum allowed transferable unit size. Therefore the means for modifying the manner of transmission could also include modifying the fragmentation of packets (a processor operable to adjust fragmentation of packets in the packet flow according to whether the packet flow includes the pause) (column 18, lines 1-17).
2. The remaining claims can be similarly rejected.
